Task 1:

Scraping LinkedIn for Jobs posted by Companies (Using Scrapy or Selenium)

Steps: -

1. Go to careerguide.com (or any other website of your choice where you can find job types). Scrape Job types from there. Subcategories divided by Categories.For eg:(Education->Tutor, Design and Art->Architect)

   URL : https://www.careerguide.com/career-options

2. Then you have to go to LinkedIn and scrape the jobs from there under the category you scraped from caeerguide which will be under a state

   (State -> category of job -> job)

   You will have to scrape 3 things from the job:

● Job position (e.g.: Analyst, Software Engineer)
● Company offering the Job
● Location of the Job (City or remote)

3. Then you have to scrape the companies page from LinkedIn. Details you have to scrape are :-
● Companies Description
● Where is it Located
● Number of Employees

   Submission Guidelines:

   ● Make a short video of the task <10mins
   ● Submit the video and the GitHub link for the same in the submission form
   ● Code should be well commented and optimized , there will be extra marks for that
